

PYTHON FULL COURSE

● Introduction to Python.

Python is a cross-platform programming language, which means that it can run on multiple platforms. like windows, mac os, linux, and has been even ported to the java and .NET virtual machines. It is free and open-source.

Atul Kumar (LINKEDIN).
NOTES GALLERY (TELEGRAM).

● Your First Python Program.

Let's create a very simple program called 'Hello world'

Type the following code in editor or an IDE and save it as hello_world.py.

```
Print ("Hello, world!")
```

You will get the following output.

```
Hello, World
```

As you can see, this was a pretty easy task. This is the beauty of the python programming language.

● Python Keywords !

Keyword are the reserved word in python.

We cannot use a keyword as a variable name, function name or any other identifiers.

They are use to define Syntax and structure of the python language.

False	await	else	import	Pass
None	break	except	in	raise
True	class	finally	is	return
and	continue	for	lambda	try
as	def	from	non local	while
assert	del	global	not	with
async	elif	if	or	yield

All the keywords except True, False and None are in lower case and they must be written as they are.

ATUL KUMAR (LINKEDIN).

NOTES GALLERY (TELEGRAM).

● Python Identifiers :

An identifier is a name given to entities like Class, functions, variables, etc.

Keyword cannot be used as identifiers

Global = 1

● Output

File "< interactive input >", line 1
global = 1
^
Syntax Error: invalid syntax

We cannot use special symbol like ! , @, #, \$, % etc., in our identifier.

a @ = 0

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

● Output

File "< interactive input >", line 1
a @ = 0
Syntax Error: invalid syntax

Python Function

● Syntax of function:

def function_name (Parameters):
" " " docstring " " "
Statement (S)

● Example of a function:

```
def greet (name):
```

```
    " " "
```

```
    This function greets to  
    the person passed in as  
    a parameter
```

```
    " " "
```

```
    Print("Hello," + name + " Good Morning!")
```

ATUL KUMAR (LINKEDIN).

NOTES GALLERY (TELEGRAM).

● How to call a function in Python?

```
>>> greet('Paul')
```

```
Hello, Paul. Good morning!
```

PYTHON OBJECT ORIENTED PROGRAMMING

→ Class:

```
Class Parrot:
```

```
    Pass
```

→ Object:

```
Obj = Parrot ( )
```

→ Methods:

Methods are functions defined inside the body of a class. They are used to define the behaviours of an object.

→ Inheritance:

Inheritance is a way of creating a new class for using details of an existing class without modifying it. The newly formed class is derived.

→ Encapsulation:

Using OOP in python, we can restrict access to methods and variable. This prevents data from direct modification.

→ Polymorphism:

It is an ability (in OOP) to use a common interface for multiple forms (data type).

INBUILT DATA STRUCTURE

● Creating a list:

1. My_list = [] # creating empty list.
2. Print (My_list)
3. My_list = [1, 2, 3 'example', 3.132] # creating list with data.
4. Print (My_list)

● Creating a dictionary:

1. My-dict = {} # empty dictionary.
2. Print (My-dict)
3. My-dict = {1: 'Python', 2: 'Java'} # dictionary with elements.
4. print (My-dict)

ATUL KUMAR (LINKEDIN).
NOTES GALLERY (TELEGRAM).

● Creating a tuple

1. My-tuple = (1, 2, 3) # Create tuple
2. Print (My-tuple)

● Creating a set

1. My-Set = {1, 2, 3, 4, 5, 5, 5} # Create set
2. Print (My-set).
